Notes

- \* Based also on studies other than those included in the reference list.
- † Species description based on only a single strain.
- × Closely related to (and possibly conspecific with) *A. pittii*, having whole genome ANI against reference *A. pittii* strains as high as 95%.
- ‡ The first name is a later heterotypic synonym of that shown in parentheses (applied for both validly and only effectively published names).
- § The first name is a synonym of that shown in parentheses as evidenced by whole-genome comparative analysis and comprehensive phenotypic testing (Nemeč & Radolfova-Krizova, unpublished).
- ¶ Strain '*A. oleivorans*' DR1 is closely related to two *A. calcoaceticus*-like strains described by Gerner-Smidt & Tjernberg (1993) (Touchon et al. 2014).
- # An effectively published name for a patented organism with restricted availability.
- Δ Taxon 21–39: designations of provisional taxa based on the congruence of genotypic and phenotypic data for taxonomically novel groups (≥2 strains per group).
- Taxon 40–95: designations of single strains of groups of strains used by Qin et al. (2021) based on the rigorous application of a 96% ANI cutoff to define species boundaries. Some of these tentative taxa belong to validly named species.
